THE EFFECT OF E-SERVICE QUALITY AND CUSTOMER RELATIONSHIP MANAGEMENT ON CUSTOMER LOYALTY WITH CUSTOMER SATISFACTION AND TRUST ASMEDIATION VARIABLES FOR INSTAGRAM USERS IN BANDA ACEH

Zulfadli, Abdul RahmanLubis and Permana Honneyta Lubis Department of Management, UniversitasSyiah Kuala, Indonesia

http://doi.org/10.35409/IJBMER.2020.3161

ABSTRACT

This research is to figure out the effectof E-Service Quality and Customer Relationship Management on customer loyalty with customer satisfaction and trust as a mediation variable. The population in this research is all customers who use Instagram in Banda Aceh. The sample is taken with Accidental sampling method. The calculation used is Maximum Likelihood Estimation (ML) and the number of sample that is 200 respondents, adjusted for Structural Equation Modeling (SEM). The mediation effectis testedusing Sobel test calculator. The result shows that E-Service Quality does not have a significant effect on Customer Satisfaction, Customer Relationship Management effects Customer Satisfaction significantly, E-Service Quality does not have a significant effect on Trust, Customer Relationship Management effects Trust significantly, Customer Satisfaction does not have a significant effect on Customer Loyalty significantly, Trust effects Customer Loyalty significantly, E-Service Quality effects Customer Loyalty mediated by Customer Satisfaction, Customer Relationship Management effects Customer Loyalty mediated by Trust, ofInstagramusers. The findings of this study prove the causality theory from before, whether influential or not, and become a new premise. The originality rests in the combination of the causality theories to be in a model, with the SEM statistical approach. The limitation risides in the amount of variables and object. These findings also contribute to the practical managers especially for the object in this research.

Keyword: E-Service Quality, Customer Relationship Management, Customer Satisfaction, Trust, Customer Loyalty.

1. INTRODUCTION

Amid the rapid development of technology, the means of communication evolved to become more modern and provide more convenience for its users. One example is Social media (social media). Customer satisfaction is the main key that must be considered in marketing services. This research is conducted on one of the Social media applications, namely instagramas an object, and involves its customers in Banda Aceh. Banda Aceh is a capital city of Aceh Province, Indonesia, which has lotsInstagram users in harmony with the highest number of city residents in Aceh Province, and its economic activites that useInstagram which continues to grow. Based on the reviews, this study aims to see the Effect of E-Service Quality and Customer Relationship

Vol. 3, No. 01; 2020

ISSN: 2581-4664

Management on Customer Loyalty with Customer Satisfaction and Trust as mediation Variables. This study builds amodel that involves 5 variables that are E-Service Quality, Customer Relationship Management, Customer Satisfaction, Trust, and Customer Loyalty.

According to (Zeithaml, Bitner and Gremler, 2017) Customer Loyalty is a situation where there is a strong desire to repurchase and reuse goods and services from a company. A according to (Kotler and Keller, 2012), customer satisfaction as an expression of emotion from customers who feel happy or dissatisfied with a product that occurs after comparing product quality with customer expectations for the product. (Moorman, Deshpandé and Zaltman, 1993) described that Trust is the willingness of someone to entrust themselves to others in an exchange due to a sense of confidence (confidence).

E-Service quality (e-s-qual) is defined as the extent to which a website facilitates efficient and effective shopping, purchasing and delivery (Zeithaml, Bitner and Gremler, 2017), and (Pine and Gilmore, 2013) suggested that Customer Relationship Management can create success or failure in a business that is with information from a series of Customer, Relationship, Management who are also capable of predicting the future assisted by people, technology and processes.

From the description above, authors build the hypothesis as follows.

H1 : E-Service Quality effectsCustomer Satisfaction significantly

H2 : Customer Relationship Management effects Customer Satisfaction significantly

H3 : E-Service Quality effects Trust significantly

H4 : Customer Relationship Management effects Trust significantly

H5 : Customer Satisfaction effectsCustomer Loyalty significantly

H6 : Trust effects Customer Loyalty significantly

H7 : E-Service Quality effects Customer Loyalty mediated by Customer Satisfaction

H8 : Customer Relationship Management effects Customer Loyalty mediated by Trust

2. RESEARCH METHOD

The population in this research is all customers who use Instagram in Banda Aceh. The sample is taken with Accidental sampling method. The calculation used is Maximum Likelihood Estimation (ML) and the number of samples that is 200 respondents, adjusted for Structural Equation Modeling (SEM).Structural Equation Model (SEM) is an accurate analysis model to be carried out in this study. By using SEM, the structural models analyzed will produce the following mathematical equations:

 $Y = \beta 1 X1 + \beta 2 X2 + \dots ..e$

On condition: Y: Endogenous Variables

Xi: The i variable that affects Y

ßi: Weight of regression for variable i

e: Error

Whereas in this study several variables that will be used are as follows: Exogenous variable or Independent variable which consists of:

a. E-Service Quality as the first exogenous variable (X1).

b. Customer Relationship Management as the second exogenous variable (X2).

Endogenous variable or Dependent Variable which consists of:

Vol. 3, No. 01; 2020

ISSN: 2581-4664

- a. The endogenous variable as the first mediation is customer Customer Satisfaction (Y1) and Trust (Y2) as the second mediation.
- b. Endogenous variables are dependent, namely Customer Loyalty (Z).

Structural Equation Model Analysis Tools

In SEM (Measurement model and structural model) there are two models of analysis tools that can be used, which is:

• Confirmatory Factor Analysis (CFA)

In the Confirmatory Factor Analysis model, each indicator will be tested for reliability construct and convergent validity. Data reaches convergent validity if the value of loading factor (standardized regression weight)> 0.5, and achieving reliability construct if reliability construct> 0.7.

• Multiple Regression Analysis

Unlike the CFA, this analysis is carried outaiming to find out how much influence between endogenous variables and exogenous variables, and how significant the influence is.

Structural Equation Model Measurement

The level of GOF (Goodness Of Fit) and the size of the acceptance of the compatibility test that are collected by several authors are as follows:

- Chi-square statistics (x2) the lower the value the better (p> 0.05), which means the model is getting better, this tool is the most appropriate test tool to find out the overall fit value, and is quite sensitive to the sample value, so chi-square (x2) is only used if the sample has a size of 100 to 200.
- RMSEA (The Root Mean Square Error of Approximation), is a limit value that becomes a benchmark for chi-square (x2) statistical values, the lower the better the value (= 0.08) is an index so the model can be accepted.
- GFI (Goodness of Fit Index), is a limitation to assess whether a data fit or not. GFI will measure the value of the variance in the sample covariance matrix mentioned by the estimated population covariance matrix. The data model that is said to be fit is data included in GFI, which has a value between 0.00 1.00. Thus the value of 0.90 can be concluded as a model that is better fit because it is within the limits of GFI values.
- AGFI (Adjusted Goodness of Fit), used to test the receipt of this Index mode can be adjusted to the existing free degrees. The recommended value of acceptance size is if AGFI = 0.90.
- CMIN / DF (The Minimum Sample Discrepancy Function), basically is one form of limitation to determine whether a data fit or not. In this indicator the statistics x2 are divided by df which is then expressed as relative x2. The relative value of $x^2 = 2.0$ or = 3.0 indicates that the model is fit with existing data.

The mediation effect is tested using Sobel test calculator, after the direct effects have their result from SEM.

Reliability Test

Tabel 2.Reliability (Alpha)

| NO | Variabel | Item Variabel | Standardized Cronbach's Alpha | Reliability |
|----|----------------------------------|------------------|-------------------------------------|-------------|
| 1. | E-Service Quality (X1) | 6 | 0.912 | Accepted |
| | Customer Relationship Management | | | Accepted |
| 2 | (X2) | 6 | 0.889 | |
| 3. | Customer Satisfaction (Y1) | 6 | 0.906 | Accepted |
| 4. | Trust (Y2) | 6 | 0.904 | Accepted |
| 5. | Customer Loyalty (Z) | 6 | 0.915 | Accepted |

Source: Primer Data, 2018 (processed).

From the results of the reliability analysis, it can be concluded that the reliability value of the research variables is categorized as achieving reliability that reaches the Cronbach Alpha criteria where the alphanumeric values are higher than 0.60.

Description of Research Variables

Based on the perception of respondents, here the overview of the indicators measured in this research.

SEM Assumption Test

Multivariate Outlier Test

Table 8.Multivariate Outlier Test

Observations farthest from the centroid (Mahalanobis distance) (Group number 1)

| Observation number | Mahalanobis d-squared | p1 | p2 |
|--------------------|-----------------------|------|------|
| 15 | 56.052 | .003 | .417 |
| 199 | 54.978 | .004 | .161 |
| 102 | 52.452 | .007 | .157 |
| 179 | 51.586 | .008 | .090 |
| 197 | 49.747 | .013 | .126 |
| 52 | 49.218 | .015 | .081 |
| 129 | 49.195 | .015 | .033 |
| 9 | 48.699 | .017 | .021 |
| 167 | 48.505 | .018 | .010 |
| 70 | 46.530 | .028 | .053 |

From Table 4.4.1 it is found that the highest cost of the mahalonobis distance is 56.052 < from the table chi square value of 59.703 ($\alpha = 0.001$, df = 30). It concludes that there is no multivariate outliers in the research data.

StructuralEquationModel(SEM)Based on the literature review and the purpose of the study, a structural model is found as
follows:

Vol. 3, No. 01; 2020

ISSN: 2581-4664

The output on the structural equation model (structural Equation Model) is fit and satisfactory for sample data with x2 (200) = 166,595 at p <.000; x2 / df = 1.543, GFI = 0.913, TLI = 0.966, CFI = 0.973 and RMSEA = 0.052. This output also shows that all loading factors in the model are significant at p <.000. As explained earlier, goodness-of-fit statistics (ie x2) must display p> .05 to get a good and fit model.

Hypotesis Test

The following is the result of a structural hypothesis test, based on the estimation and significance values.

| | Hypotesis | Condition |
|----------------|--|--------------|
| H_1 | E-Service Quality effects Customer Satisfaction significantly | Х |
| H ₂ | Customer Relationship Management effects Customer Satisfaction significantly | |
| H ₃ | E-Service Quality effects Trust significantly | Х |
| H_4 | Customer Relationship Management effects Trust significantly | \checkmark |
| H ₅ | Customer Satisfaction effects Customer Loyalty significantly | Х |
| H ₆ | Trust effects Customer Loyalty significantly | \checkmark |
| H ₇ | E-Service Quality effects Customer Loyalty mediated by Customer Satisfaction | |
| H ₈ | Customer Relationship Management effects Customer Loyalty mediated by Trust | |

Table 9.Hypotesis Test

Vol. 3, No. 01; 2020 ISSN: 2581-4664

4. CONCLUSIONS

The result shows that E-Service Quality does not have a significant effect on Customer Satisfaction, Customer Relationship Management effects Customer Satisfaction significantly, E-Service Quality does not have a significant effect onTrust, Customer Relationship Management effects Trust significantly, Customer Satisfaction does not have a significant effect on Customer Loyalty significantly, Trust effectsCustomer Loyalty significantly,E-Service Quality effects Customer Loyalty mediated by Customer Satisfaction, Customer Relationship Management effects Customer Loyalty mediated by Trust, of Instagram users in Banda Aceh.The findings of this study prove the causality theory from before, whether influential or not, and become a new premise. The originality rests in the combination of the causality theories to be in a model, with the SEM statistical approach. The limitation risides in the amount of variables and object.

These findings also contribute to the practical managers especially for the object in this study.Customer Relationship Management has a strong influence in increasing Trust and Customer Loyalty. Therefore Instagram must focus on these factors to increase Trust and Customer Loyalty of Instagram users in Banda Aceh.Trust factor is the most dominant factor, and is able to mediate a significant influence between Customer Relationship Management and Customer Loyalty, the company needs to pay attention and maintain this factor to be a key in the marketing strategy, so as to increase the number of loyal customers.On the other hand, E-Service Quality is less dominant factor in influencing Customer Satisfaction and Customer Loyalty. However,Instagramstill need to focus on this factor if they want to increase their number of loyal customers.
